

## THE EUROPEAN STANDARD, EN442, FOR HOT WATER RADIATORS

AEL radiators (**EN442**) and valves (**EN215** & ISO9001) have been manufactured to comply with the highest standards in Europe for more than 25 years, the AEL product range has not only proven to be reliable but also aesthetically pleasing to enhance the interior of many private and public buildings.

The **EN442** standard was brought into force to define “heat measurement sampling” for hot water radiators in all European countries.

The **EN442** standard constitutes a positive step forward to ensure that any radiators tested and approved will provide the stated heat output required and also give a guarantee that the product will be fit for purpose.

The **EN442** standard was brought into force not only to provide a guarantee that the stated output of radiators from reputable manufacturers are correct but also to highlight and deter the use of poor quality untested radiators into European installations.
